Poverty and Expenditure in Northern Ghana in 2015

Vincent Amanor-Boadu, PhD
Kansas State University – USAID METSS

Presented at the 2016 PBS Meeting

Alisa Hotel, Accra

March 17, 2016

USAID
FROM THE AMERICAN PEOPLE

Context

Feed the Future Initiative is USG food security and poverty alleviation program driven by country strategic plans

FTF Initiative tracks intervention investments' performance using a number of indicators

Ghana's baseline indicators established in 2012 and midline study tracking progress conducted in 2015

This conference is about our tracking progress

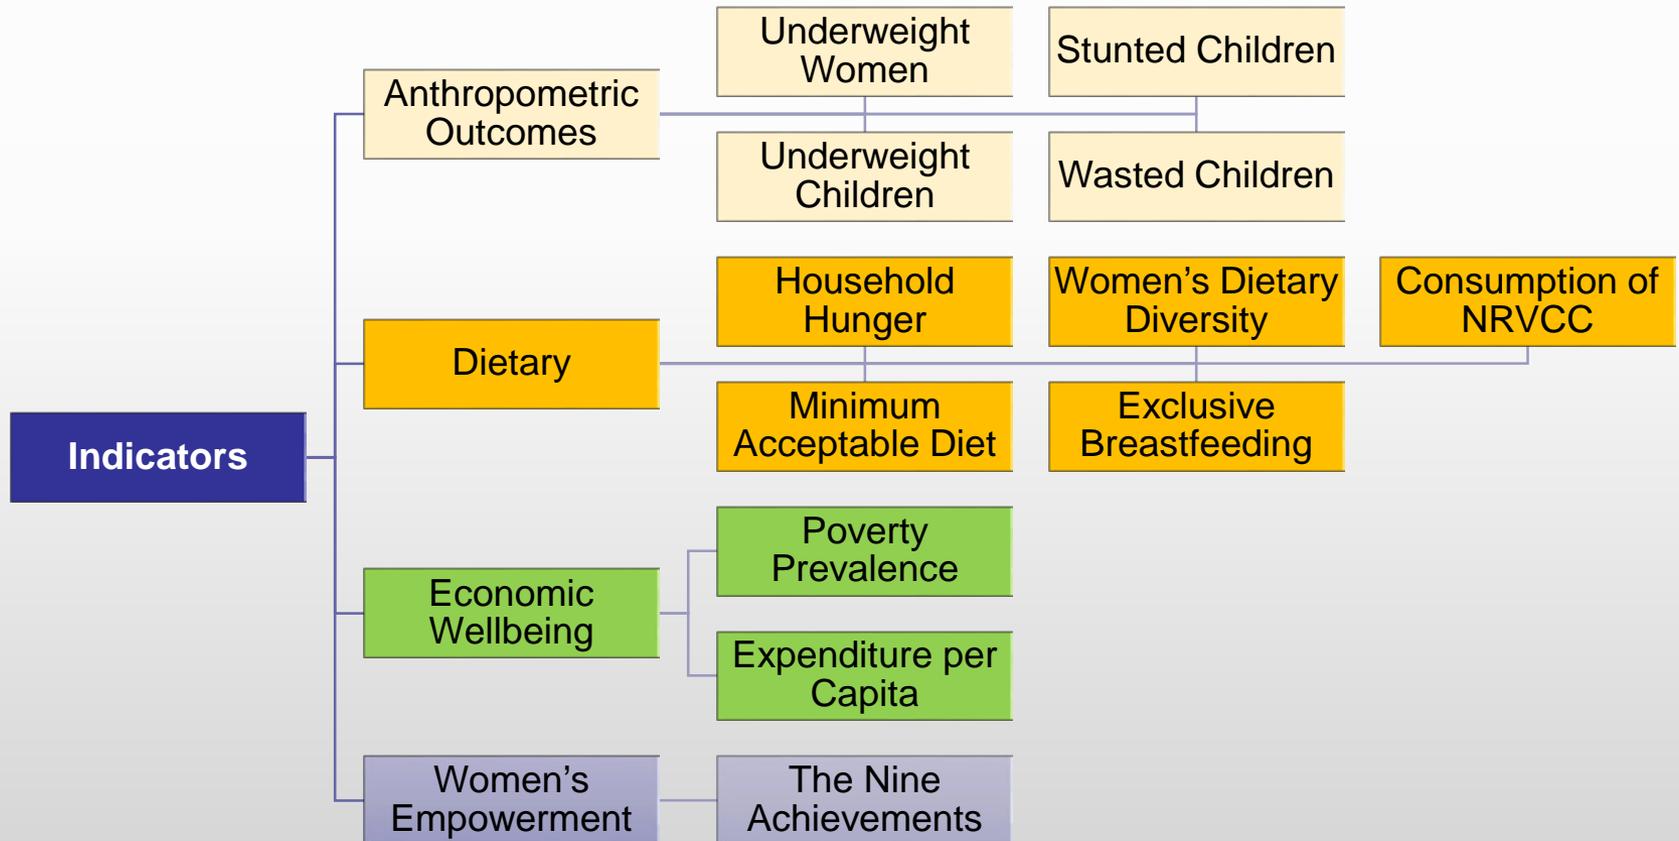

2015 Survey Structure

- Reporting changes in the indicators from 2012 based on original 4,410 households
- These households were sampled using a 2-stage probability sampling approach
 - Stage 1: Probability proportional to size approach to select EAs
 - Stage 2: Systematic sampling approach to select 20 households per EA

The Feed the Future Indicators

Expenditure in PPP

- Estimate is in 2015 Cedi value and has to be converted into international currency (PPP) for comparison
- Conversion addresses inflation and exchange rates using the following formula

$$X_{2005}^{PPP} = \frac{X_{2015}^{GHS} I_{2005}}{I_{2015} \rho_{2005}}$$

Where I is the CPI, X is the expenditure, ρ is the PPP conversion factor & subs are ref years & supers are currencies

USAID
FROM THE AMERICAN PEOPLE

Establishing the Poverty Threshold

Not
Poor

$$X \geq \$1.25$$

Poor

$$X < \$1.25$$

Poverty is determined by per capita expenditure, which is dependent on household size

USAID
FROM THE AMERICAN PEOPLE

Expenditure and Poverty

Take two households, same total expenditure but different sizes

- Household I = 10 people; Household II = five people; total daily household expenditure = \$10 each
- Average per capita expenditures are respectively \$1 and \$2
- Prevalence of poverty at the household level (poverty line = \$1.25) is 50%
- At the individual level, the prevalence of poverty is 67%
- If HH I has 12 members, then individual headcount poverty rate is now 70.6% but remains unchanged under household level estimates

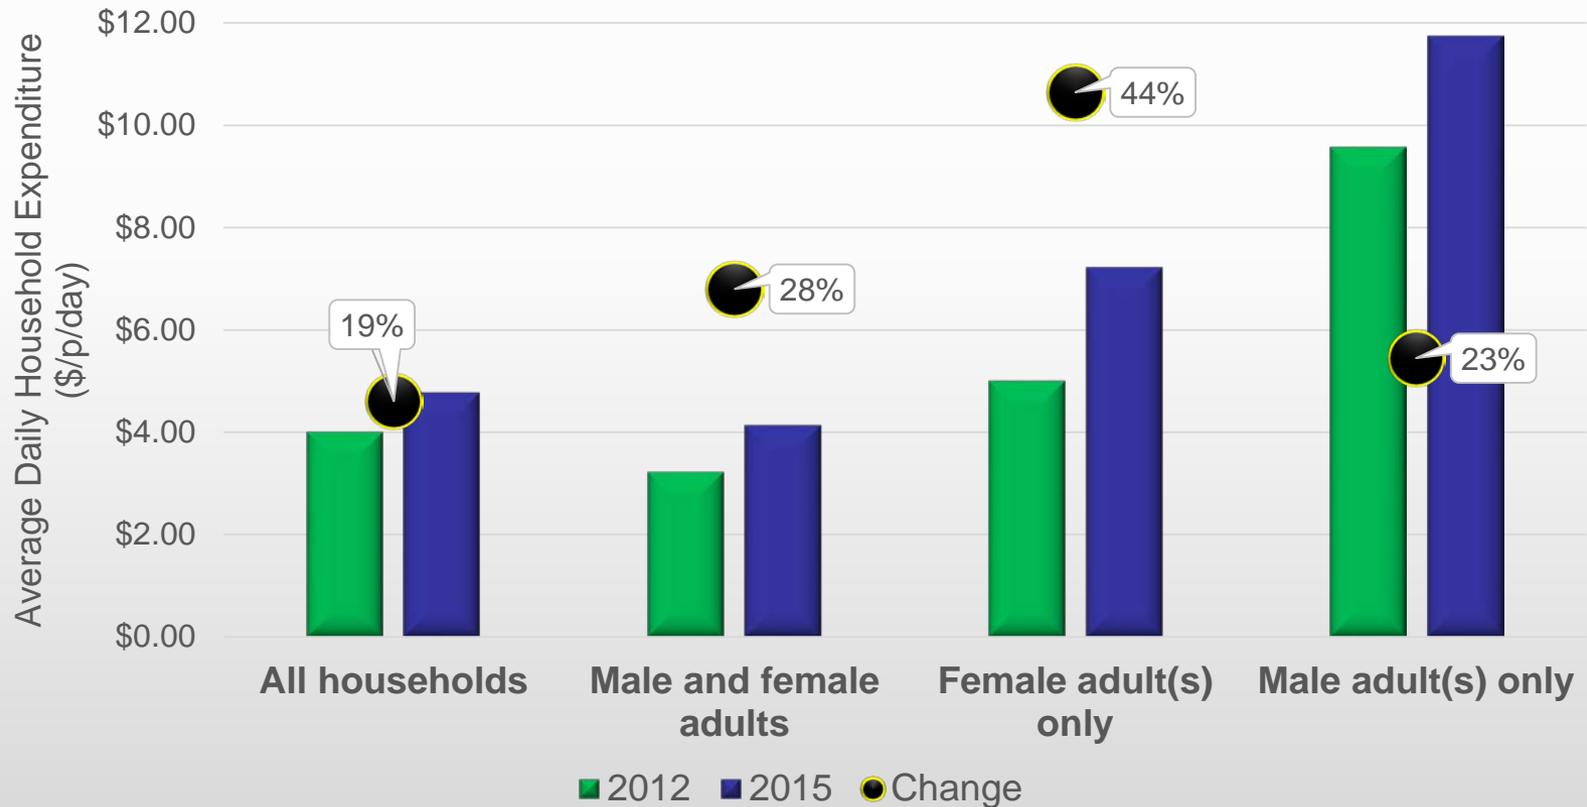

Expenditure and Poverty

- So, how many variables can affect the estimate?
 - The poverty threshold used
 - The calculation of expenditure and assumptions about prices, etc.
 - Time of year data are collected given vulnerability of poor to cyclical consumption patterns
 - The inflation rates used – determined by period of data collection and reference periods
 - The PPP conversion factor used
 - How the incidence is measured
 - The weights that are applied, which is determined by the sample size and the reference population being used
 - How outliers are treated

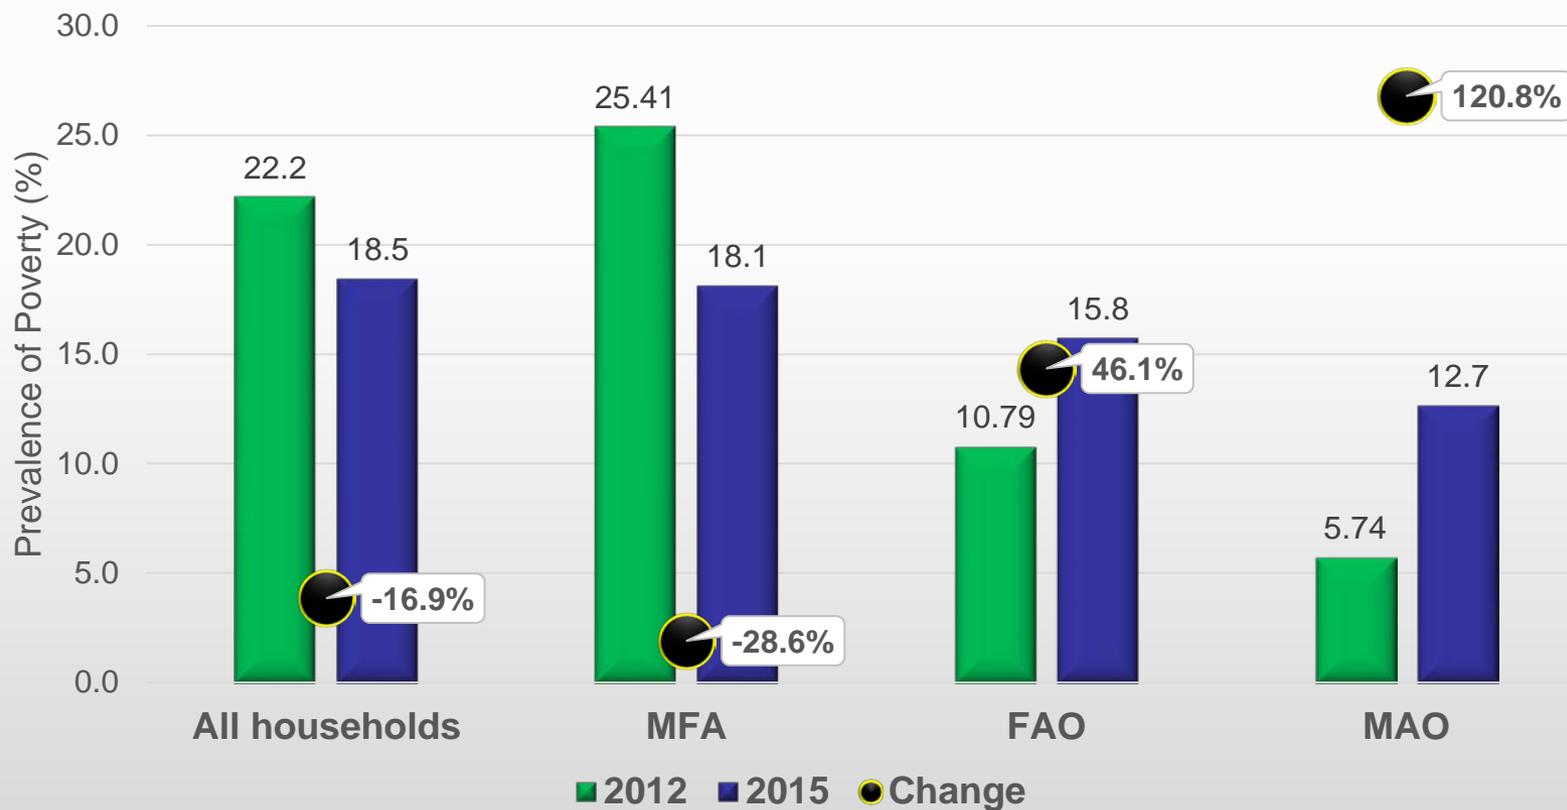

Change in Expenditure by Gendered Household Types

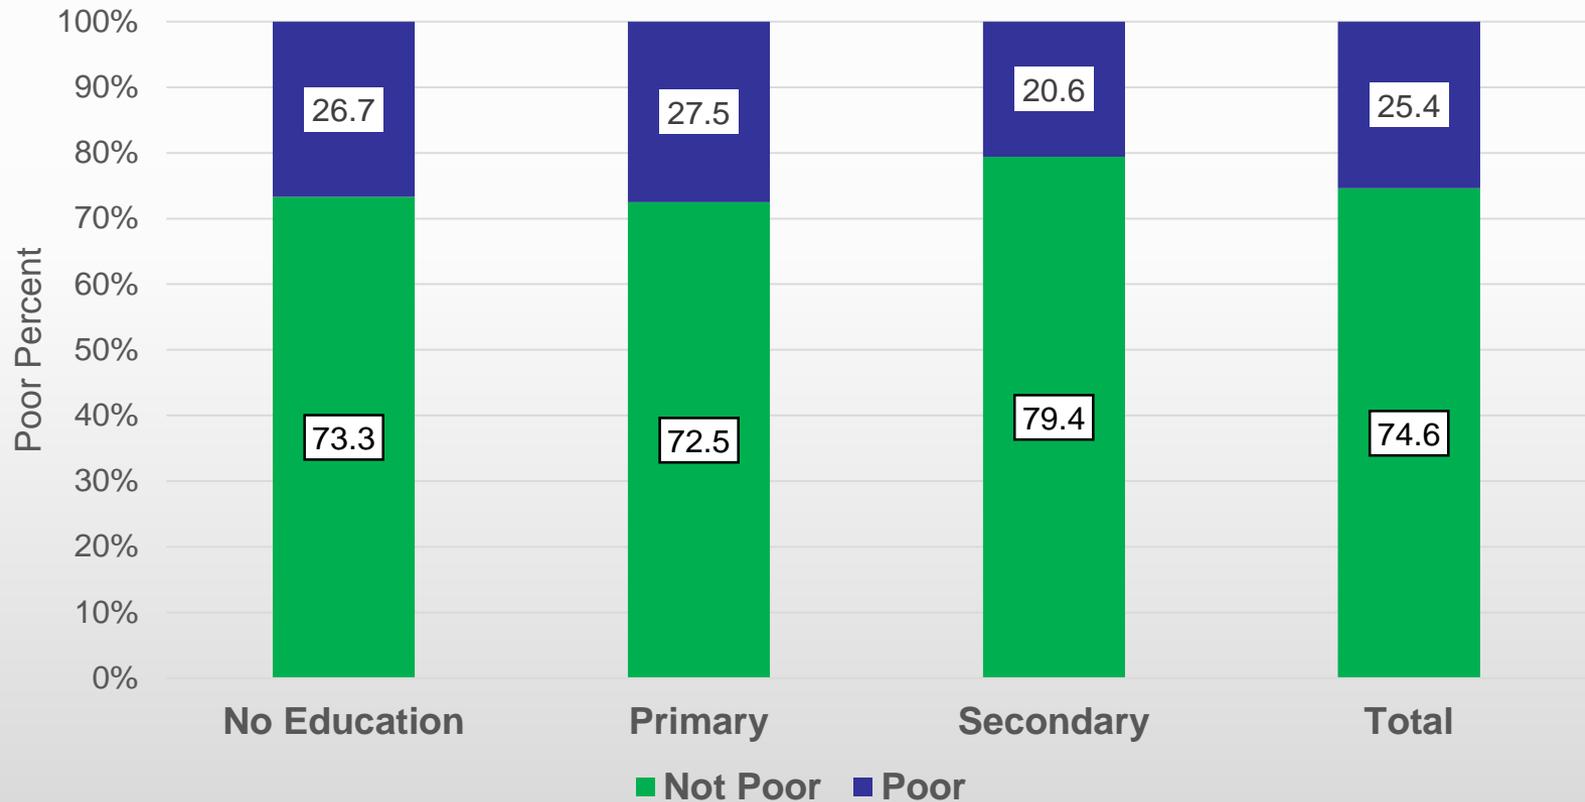

Change in Poverty by Gendered Household Types

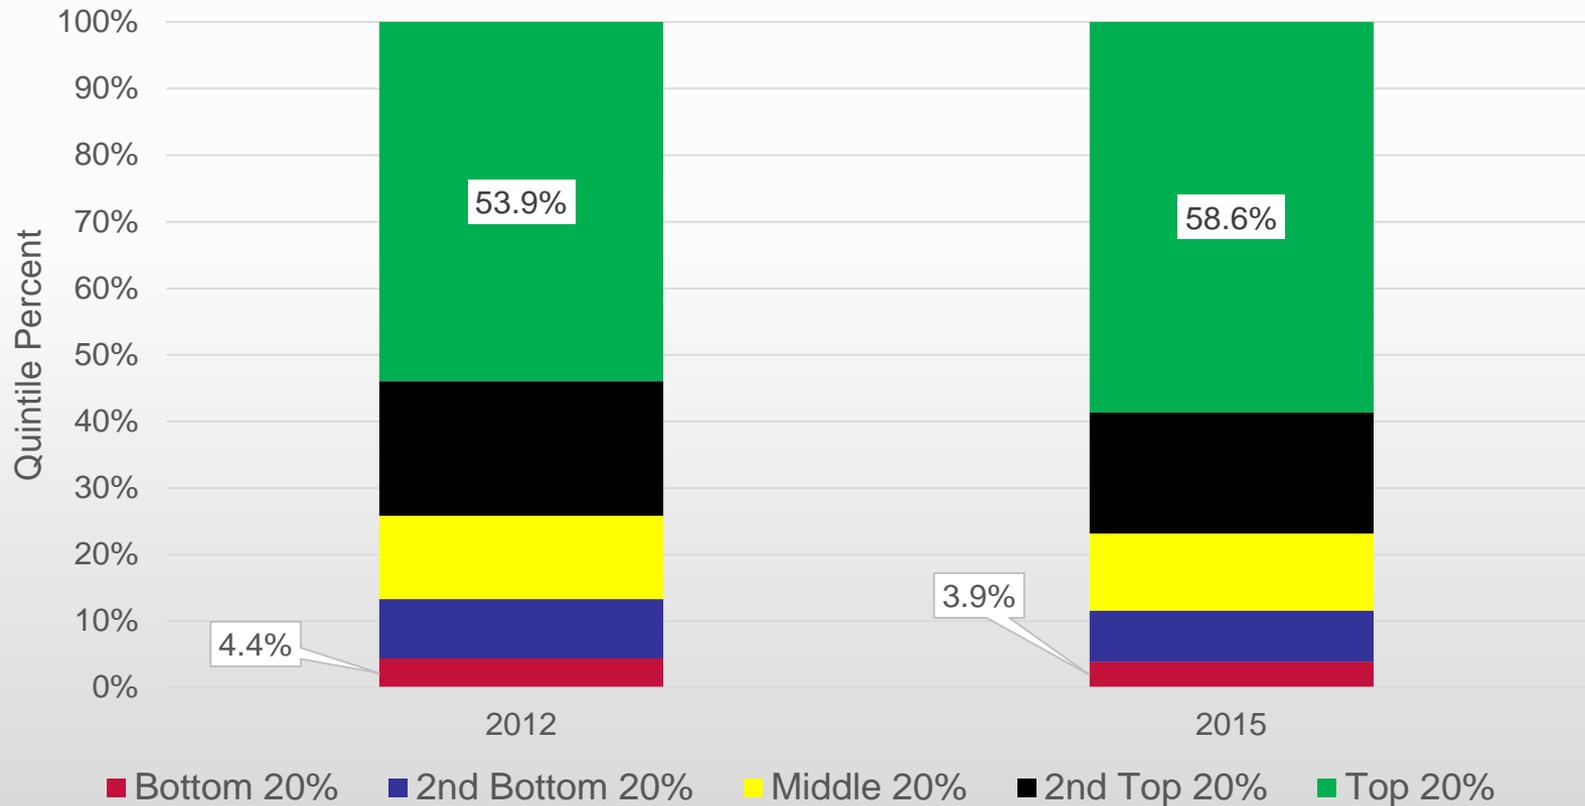

Poverty & Education Level

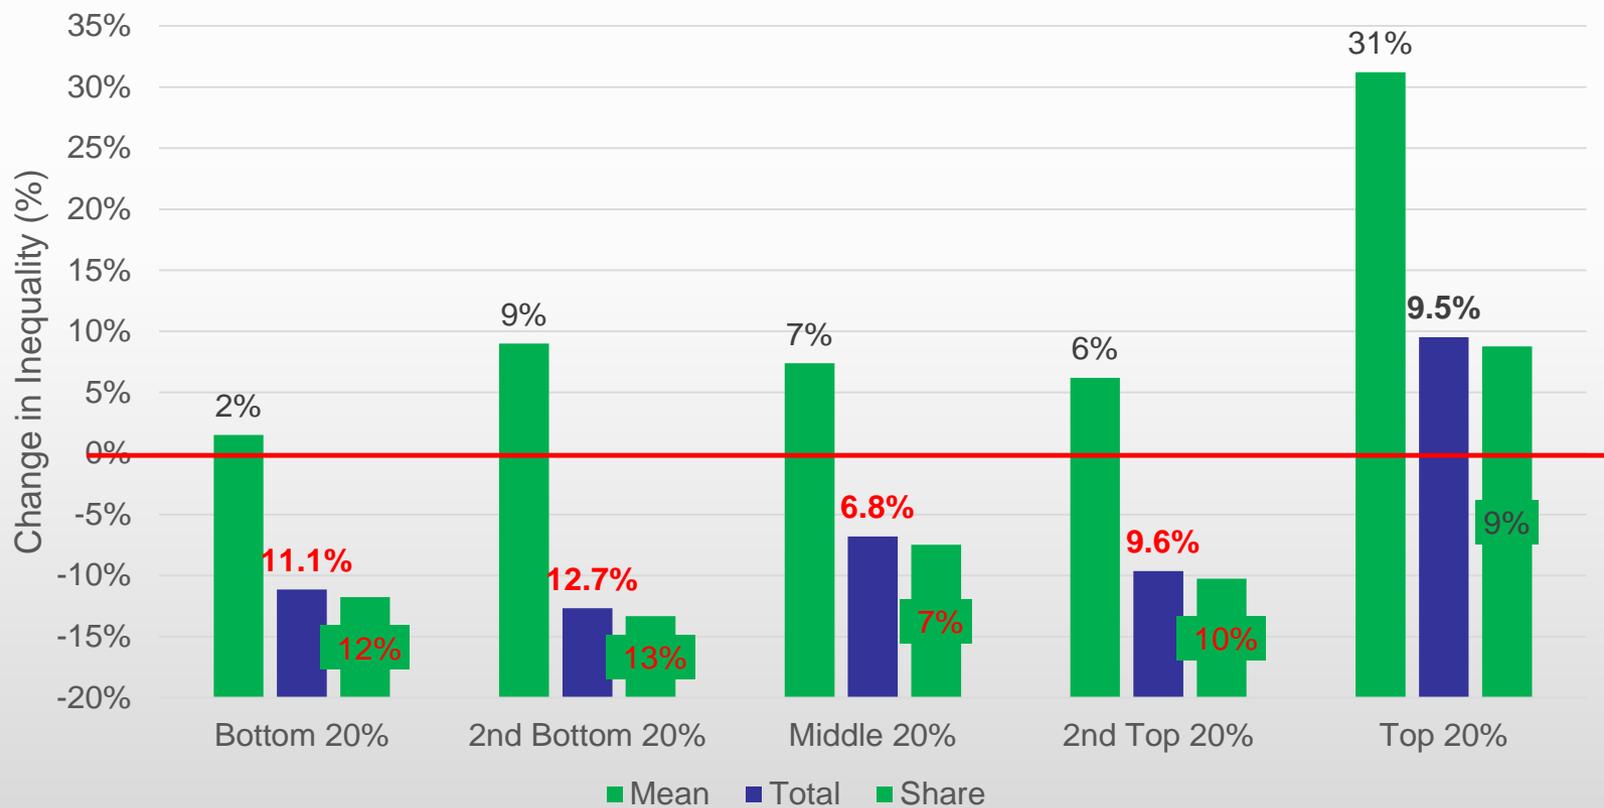

Inequality Indicator: Distribution of Consumption by Quintiles

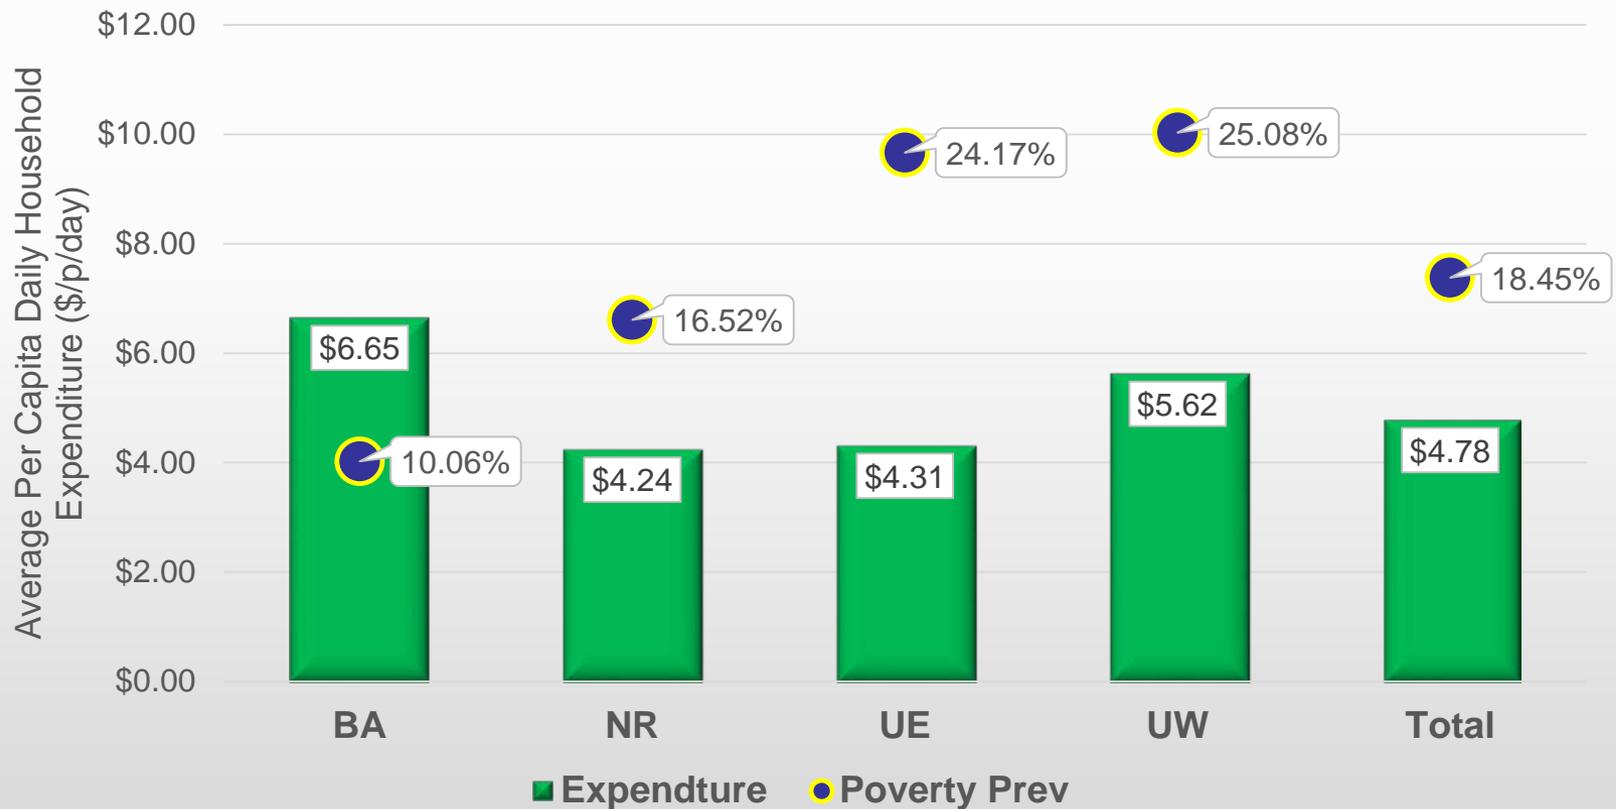

Change in Inequality 2012-2015

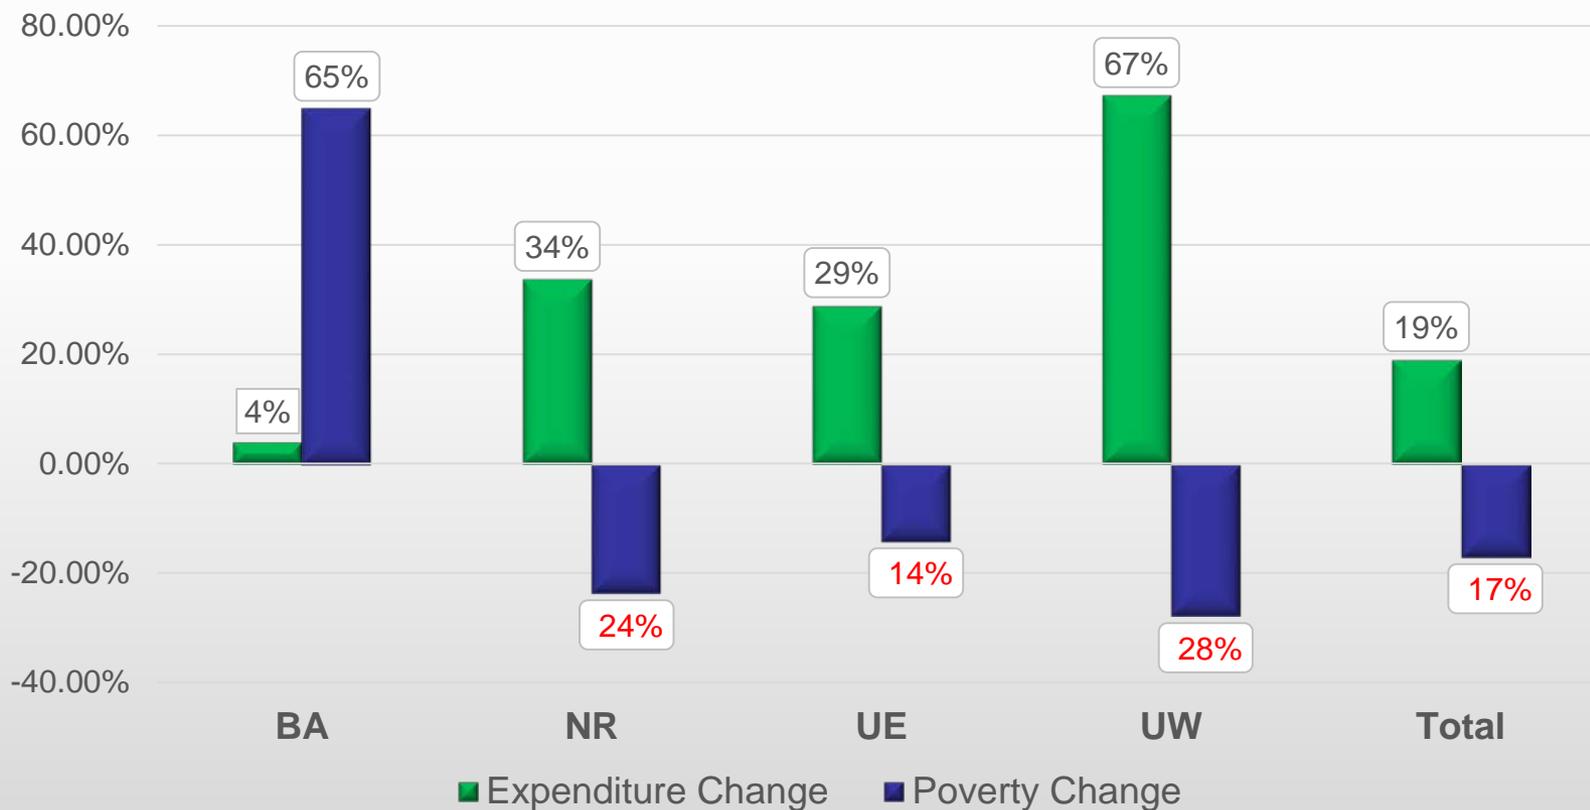

Expenditure and Poverty by Region (2015)

Expenditure and Poverty Change by Region (2015 v 2012)

USAID

What Can We Learn?

- How are those counted as poor differ from those who are not?
- The probability of being among poor households is determined by education (E), gendered household type (G), household size (H), location (L), and food share of total expenditure (F)

$$P = f(E, G, H, L, F)$$

USAID
FROM THE AMERICAN PEOPLE

What Can We Learn

- Compared to BA, the odds of being poor is 1.9 times higher in NR, 2.9 times higher in UE and 4.1 times higher in UW
- There is no statistically significant difference between MFA and the other gendered household types when it comes to the probability of being counted among the poor
 - FAO households differ but only at the 10% level, with a higher odds of about 1.5 times

USAID
FROM THE AMERICAN PEOPLE

What Can We Learn

- The odds of being poor with education is about 0.6 times the odds of being poor without education
- Every member increase in household size increased the odds of being poor by 23%
- Every increase in percent increase in food share of total expenditure reduces the odds of being poor 14%

USAID
FROM THE AMERICAN PEOPLE

What Can We Learn

Implications

The three northern regions are still vulnerable despite progress in poverty reduction

Investments in education very important on reducing poverty risk

USAID
FROM THE AMERICAN PEOPLE

Take Aways

- Expenditures have increased
- Poverty prevalence has declined from the baseline
- However, the gap between the top and the bottom quintiles has increased
- Policymakers can help poverty alleviation by facilitating the enabling environment
- Individuals can do their part by enhancing their education and investing that of their kids

USAID
